Washington, DC 20554

Re: TR Docket No. 11-109

Dear Ms. Bowtsch:

I would like to urge the Commission to voice support for you to keep working to help resolve interference issues with GPS devices and new cell phones. I've read that a new company is working to build the new, big cell network that will allow phones to move more data and operate on the internet easier.

The demand for wireless service that will do just this is growing at an extremely rapid rate, so we can't seem to build the networks fast enough. Since it seems like the big cell companies keep buying up the small ones, it's even more important to start working on a new network now. Because what happens if competition goes away? All the wonderful things and inventions on cell phones might just be canceled out.

One company is the best candidate to create new competition in the cell phone and wireless network market: lightSquared.

This new wireless provider is actually a known and stable group who has been working to get your approval for a decade. And believe that they were building a strong cell company that is small but just as good as any of the "big boys". They have put them in a place to build a nationwide 4G LTE network that will cover all of the country within four years, thanks to their hard work. They're also going to use private investment to build the network and it will put people back to work right away.

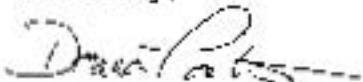

LightSquared is closing the digital divide that we've made so much about that is isolating poor areas of America back just because they don't have fast internet connections or enough reception to use cell phones more effectively for small businesses. So it seems unfair to let the GFS industry 'win' a leg up here or stop a new technology group from being successful.

My last thought is about what this will do for Massachusetts. Most people think of Boston but Massachusetts is really a collection of villages and small towns with town squares like you would see in Kansas or Kentucky. And these days in some part of the town square there's a cell phone provider office for one of the 'big' three providers. There isn't a lot of choice for people when that's our only option. LightSquared is working to shake up the industry by selling this network to people wholesale. That's fine, and it will save us money.

So please consider letting good prevail in this case. LightSquared is a good company with a good plan that will create jobs and bring down costs for people when we head to the town square looking for a deal.

Thank you for your time,

Sincerely,

Ms. Donna Portor
